Product Requirements Document - Release 0.1

Document status	Approved for implementation
Product version	0.1
Audience	Software developer implementing the reference application
Deployment target	Locally running web application
Purpose	Initial reference release; later requirements will be issued after this version is implemented

Implementation constraint: Implement only the requirements in this document. Do not add functionality solely to anticipate future releases. Reasonable internal design choices are yours to make.

1. Background

The support team currently tracks incoming customer problems in a shared spreadsheet. This is becoming difficult to manage as the number of requests grows. The team needs a small local web application that provides a structured way to record, find, update, close, reopen, and remove support requests.

This release is intentionally limited. Assume one support employee uses the application at a time. Authentication, permissions, hosting, and multi-user collaboration are not required.

2. Primary User

The primary user is a support employee who receives support requests through phone calls, email, or other channels and manually records them in the application.

3. Functional Requirements

3.1 Tickets

The application must allow the user to create a support ticket.

- Each ticket must contain a subject.
- Each ticket must contain a description.
- Each ticket must contain the requester's name.
- Each ticket must contain the requester's email address.
- Each ticket must record the date and time at which it was created.
- Each ticket must have a status.
- Subject, description, requester name, and requester email are required.
- New tickets must automatically have the status Open.
- The creation date and time must be recorded automatically and must not be editable.

3.2 Ticket Overview

The application must provide a page showing all tickets. Tickets must be shown with the newest tickets first.

- The overview must display the ticket subject.
- The overview must display the requester.
- The overview must display the status.
- The overview must display the creation date.
- The user must be able to search tickets by subject or requester name.
- The user must be able to filter the overview to show all tickets, open tickets, or closed tickets.

3.3 Ticket Details and Editing

Selecting a ticket from the overview must open a detail page displaying all information associated with the ticket.

- The user must be able to edit the subject.
- The user must be able to edit the description.
- The user must be able to edit the requester name.
- The user must be able to edit the requester email.
- The creation date and time cannot be changed.

3.4 Closing and Reopening Tickets

- An open ticket can be closed.
- A closed ticket can be reopened.
- Closing or reopening a ticket must immediately be reflected in the ticket overview.

3.5 Deleting Tickets

- The user may permanently delete a ticket.
- The application must request confirmation before the ticket is deleted.

4. Persistence

- Tickets must remain available after the application has been stopped and started again.
- No import or export functionality is required.

5. User Interface

- The application must run in a normal desktop web browser.
- The interface should be functional and reasonably presentable.
- Custom visual design is not required.
- Responsive mobile support is not required.

6. Out of Scope

Do not implement the following as part of Release 0.1:

- Authentication or user accounts
- Permissions or roles
- Multiple support employees or collaboration features
- Ticket assignment
- Ticket priorities
- Comments or notes
- Attachments
- Notifications
- Email integration
- Reporting or dashboards
- Audit history
- Cloud hosting
- Customer-facing functionality

7. Acceptance Scenario

Release 0.1 is considered complete when the following end-to-end scenario can be performed successfully:

1. Start the application locally.
2. Create a ticket containing valid subject, description, requester name, and requester email values.
3. See the new ticket in the ticket overview.
4. Find the ticket using search.
5. Open the ticket detail page.
6. Modify its editable information and save the changes.
7. Close the ticket.
8. Filter the overview to closed tickets and find it.
9. Reopen the ticket.
10. Stop and restart the application and confirm that the ticket still exists.
11. Delete the ticket after confirming deletion.

8. Product Constraints and Assumptions

- This is a reference implementation intended to run locally.
- Only one active human user needs to be supported for this release.
- The implementation technology and internal architecture are developer decisions unless constrained by the functional requirements above.
- The release should preserve a clear upgrade path in normal software-engineering terms, but no feature should be added solely because it might be useful in an unspecified future release.
